LIVE DRY VACCINE AGAINST  
AVIAN INFECTIOUS  
ENCEPHALOMYELITIS

## Live dry vaccine against avian infectious encephalomyelitis

- **Disease:** avian infectious encephalomyelitis (AIE)
- **Strain/serotype:** CALNEK 1143 M
- **Type:** live dry
- **Container:** 3 cm<sup>3</sup> bottle
- **STO:** 00495527-0083-2013

### ■ Description

Vaccine is a dry homogeneous porous mass of lightbrown colour that completely dissolves in water for 1–2 minutes.

### ■ Indications

The vaccine is intended for specific prevention of avian infectious encephalomyelitis in breeding and commercial poultry farms.

### ■ Route of administration

Clinically healthy replacement pullets should be vaccinated at the age of 2 months or older but at least one month before egg-laying period. The vaccine is administered orally with drinking water.

### ■ Immunity

The immunity develops in vaccinated birds on day 21–30 after vaccination and is life-long.

### ■ Storage conditions

The vaccine is stored in dry dark place at 6° C or less for 18 months. The vaccine can be stored at sub-zero temperatures.
